

Prepare your self lovely moisturizing drinking water, often directly from tap supplies.

Precious Prill Beads

Magnesium Oxide

Precious Prills are receivers of the physical force of Love. Precious Prills both accumulate the ambient Love of the world and receive this force from designed and enhanced sources.

Placing common water in contact with Precious Prills causes a remarkable thinning of that water. The resultant liquid is known in nature as "Dew". Dew is about half the thickness of common water. Skin tissue absorbs it where it repels common water. This can be the moist internal tissue of the digestive tract or the somewhat drier tissue (skin) found on the outside of the body.

We use Precious Prills to make lovely moisturizing drinking water, often directly from tap supplies.

100% Magnesium Oxide treated by an inovative bio-resonance process make Precious Prill Beads. Jim Carter inventrd this transforation process which is taking place in Jim's 'Star Chamber'.

The magnesium oxide does not disolves in the water.

Living cells that are properly filled/hydrated have excellent dynamics, while cells that are under-inflated or perhaps even worse, over-inflated, are extremely vulnerable, both to absorption of toxic energies and to attack from predators.

It is admitted that living cells, whether simple or complex are principally constructed of water. Proper liquid stasis relates directly to cellular longevity and cellular longevity relates directly to longevity itself.

Because this liquid doesn't support lower life forms such as germs, bacteria or fungi, it can be said to be antiseptic. Even though the alteration of physical characteristics of water by Precious Prills does seem to render this liquid far cleaner that its parent "common water", Precious Prills were not designed to be a water purification device. Some waters may require pre-treatment. There are many other adequate water purification devices (filters) available.

Preparing Your Self Precious Prill Water:

Placing the package of Prills (or preferable disburdening Prills from little bag) in a glass container and filling it with about four litres of common water makes precious Prill water.

After an initial period of 24 hours, three litres (3/ 4 of the prilled water) can be removed for use and the container refilled. This can be done every hour thereafter.

Precious Prill water should only be made in glass containers, or glazed ceramic. After it is made, it can be transferred into good plastic containers safely.

Obviously the better the quality of the starting water, the better the result.

Precious Prills are also powerful environment-restoring tools: Restoring the dew of our planet is restoring its future. When you make and use Precious Prill water, while enjoying life a bit more, you become one of the active environmentalists on this planet.

One Bag Precious Prill Beads contains 90g

With this, after 24 h starting-t-procedure you will be able preparing 3 liter of prill water every hour.

Euro 27.- / plus shipping. / ordering 5 bags or more: 1 Bag € 17,85
